

What scholarly infrastructure has supported this STS formation?

Established in 2016, IstanbulLab -Science, Technology, Society Platform in Turkey- provides a collaborative and transdisciplinary research platform for academics, activists, and artists engaged in the social studies of science and technology within the Turkish context and beyond. As an independent research initiative, IstanbulLab aspires to stimulate the generation and spread of critical and constructive studies of Science, Technology, and Society in Turkey. IstanbulLab members conduct research in different yet related areas such as "technology and democracy," "feminist science and technology studies," "political economy of bios," "energy infrastructures and political ecology," "emerging technologies and alternative futures," and "curating as transdisciplinary research." | Image: Wire Walker, Mehmet Ali Boran, 2014 | Code Unknown Exhibition | Curated by Ebru Yetişkin
