

A collaborative infrastructure. An infrastructure is a road that has to be taken thousand times. The repetitive nature of the usage of infrastructure justifies the investment of matter, time, people, space, work, and money (for some infrastructure so much money). This is what it takes to the structure to be infrastructured. There is also another thing that makes the difference between a structure and an infrastructure? The second is hidden from user that naturalize its existence (they do not think at the infrastructure when they use it – well STSers does) and is based on material configuration that tend to be understood by civilian as the opposite of politics. Collaboration and infrastructure may seem antithetical concepts. Collaboration is occasional, interested, if you want to collaborate you collaborate if you don't you don't, you can collaborate one time and not the next... collaboration is based on the conscious of the collaborator that is collaborating that is the opposite of an invisible road. A collaborative infrastructure is the stabilization of constant collective deliberation - this is too unstable – is the stabilization of a group of STS people that concord around the stabilization of a tech-ethical material configuration to do the thing they want to do in the world they desire to.
